

Prepare & Guide Patients Remotely via Mobile Devices

Buddy Healthcare – We digitize clinical care pathways to remotely monitor and guide patients

We help healthcare providers to digitize care processes and connect clinical teams with patients through a digital solution that reduces administrative burden and improves patient experience and outcomes. The all-in-one **software as a service** (SaaS) consists of a mobile app for patients, a web-based clinical dashboard for care personnel & digitized care pathways management service.

Our goal is to help patients become more informed & engaged in their care while helping hospitals to monitor & manage multiple patients' progress simultaneously. By providing a secure communication channel between patient and hospital, our solution enables patients to become more active and thus potentiates better outcomes and patient experience.

Benefits for Patients

- 24/7 access to all care-related information & educational materials
- Transparency in care progress and access to all needed information whenever, wherever
- Conversation feature connects patients remotely to healthcare professionals
- Easy completion of digital forms when and where it is convenient for patients
- Option to include patient relatives in the care process
- Supporting patient engagement in their own care to foster better outcomes

Mobile Information Portal for Patients

The pocket-sized information portal is an app that helps patients to seamlessly navigate their care process & access care-related information. Automated notifications & reminders ensure that patients get **the right information at the right time**, properly preparing them for appointments or procedures.

Patients can instantly submit digitized medical forms and questionnaires to hospital personnel, while the portal provides a secure, two-way, real-time communication channel.

Dashboard Solution for Care Teams

By using the care coordination dashboard, healthcare providers have a comprehensive, real-time view of all the patients enrolled in a clinical care pathway. The dashboard provides clinics with extensive capabilities to ensure patient compliance with their care plan. Dashboard notifications specifically identify patients who are deviating from their care path or who present a risk factor (for example: Fever, BMI, pre-existing conditions).

The automation and digitization of processes reduces repetitive administrative work and therefore makes more **Time to Care** for direct patient care. The platform enables the collection of standardized outcomes and quality questionnaires. This allows hospital management to assess care path efficiency and to evaluate clinical service quality.

Benefits for Hospitals & Clinics

- Secure communication channel between patient and care team
- Automate patient monitoring for multiple patients
- Significantly reduce administrative time and paperwork
- Increase patient compliance to help reduce no-shows and cancellations
- Data collection & analysis for operational decision-making
- Modular platform can be used across different medical specialties and departments
